THE TOTAL REAL CAPITAL STRUCTURE ANALYSIS IN THE PROFITS MASS RELEVANT FOR TURNOVER

CONSTANTIN CĂRUNTU,
LOREDANA MIHAELA LĂPĂDUȘI *

ABSTRACT: The mechanism operator of total actual capital on profit afferent turnover in the synthesizer manner is an important tool in assessing the economic and financial performance of the company both internally and in the diagnostic tests performed outside. Addressed the overall level of business, real capital - fixed and circulating - appears as part of operating capital; with all other forms of total capital operated in the frame of business activity, actual capital is involved in a specific circuit, arising from the operation of producer agents in a market economic environment. The transformation of the company liquid capital in productive real capital takes place in conditions in which the firm is presented on the capital goods market as a buyer and actually proceed to the purchase of goods-capital needed for production. Simultaneously, the company is presented as a buyer and the labour market, drawing work resources required.

KEY WORDS: total capital, fixed capital, circulating capital, profit, turnover, rentability

In order to illustrate the total real capital structure through the technical structure of profit related to turnover, named thus \( \frac{K_f}{K_t} \) could use the following analysis methods:

\[
P = K_t \cdot \frac{K_f}{K_t} \cdot \frac{K_f}{K_f} \cdot \frac{C_A}{C_A} \cdot \frac{P}{K_f} \cdot \frac{K_f}{K_f} \cdot \frac{P}{K_f} \cdot \frac{K_f}{K_f} \cdot \frac{P}{P} \cdot \sum q_v \cdot p
\]  

(1)

\[
P = \frac{1}{100} \left( K_t \cdot \frac{K_f}{K_t} \cdot \frac{K_f}{K_f} \cdot \frac{C_A}{C_A} \cdot \frac{P}{K_f} \cdot \frac{K_f}{K_f} \cdot \frac{P}{K_f} \cdot \frac{K_f}{K_f} \cdot \frac{P}{P} \cdot \sum q_v \cdot p \right) \cdot \frac{R_C}{R_C}
\]

Lecturer, Ph.D., „Constantin Brâncuși” University of Tg.-Jiu, Romania, loredana@utgjiu.ro
where:
P - the profit afferent to turnover;
Kt - the total real capital;
Kf - the fixed capital;
\[
\frac{Kf}{Kt}
\]
- the share of fixed capital in total real capital;
Kfa - the fixed operating capital;
\[
\frac{Kfa}{Kf}
\]
- the share of fixed operating capital in fixed total capital;
CA - the turnover;
\[
\frac{CA}{Kfa}
\]
- the turnover to 1 RON afferent to fixed operating capital;
\[
\frac{P}{CA}
\]
- the profit afferent to turnover;
qv - the production sold;
\[
\frac{p}{qv}
\]
- the medium price of sale;
\[
qv \cdot \frac{p}{qv} = p
\]
- the turnover expressed in sale prices;
\[
\frac{Rc}{P}
\]
- the medium ratio of commercial rentability.

In order to illustrate this, we consider the data from next table:

<table>
<thead>
<tr>
<th>No.</th>
<th>Indicators</th>
<th>(P_0)</th>
<th>(P_1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Total Capital</td>

</tbody>
</table>

Accordingly to the mentioned pattern, it is operating with multiple variables on total real capital and it is understood that through average profit on 1 RON turnover is surprises synthesized aspects of using both fixed, circulating capital and labour (reflected in costs and prices sale).

In these conditions means that in the mass of profit, appropriate to modification, are found these influences:

1. The influence of total capital (fixed and circulating):
The Total Real Capital Structure Analysis in the Profits Mass ...

(1) The influence of fixed capital share in total real fixed capital (technical structure of capital):

\[
(K_t - K_{t_0}) \frac{K_f}{K_{t_0}} \frac{K_f}{K_{t_0}} \frac{C_A}{C_A} \frac{P_0}{C_A} =
\]

\[
= (8.798.337 - 8.490.586) \frac{5.878.100}{8.490.586} \frac{2.939.050}{5.878.100} \frac{23.512.376}{2.939.050} \frac{2.685.126}{23.512.376}
\]

\[
= 307.751 \cdot 0.6923 \cdot 0.5 \cdot 0.1142 = +97.323,989 RON
\]

2. The influence of fixed capital share in total real fixed capital (technical structure of capital):

\[
K_t \left( \frac{K_f}{K_{t_0}} \frac{K_f}{K_{t_0}} \frac{C_A}{C_A} \frac{P_0}{C_A} \right)
\]

\[
= 8.798.337 \cdot \frac{6.000.000}{8.798.337} \frac{5.878.100}{8.490.586} \frac{2.939.050}{5.878.100} \frac{23.512.376}{2.939.050} \frac{2.685.126}{23.512.376}
\]

\[
= 8.798.337 \cdot (0.6819 - 0.6923) \cdot 0.5 \cdot 0.1142 =
\]

\[
= 8.798.337 \cdot (-0.0104) \cdot 0.5 \cdot 0.1142 = -41.798,436 RON
\]

3. The influence of share operating fixed capital in total fixed capital (technological structure of fixed capital):

\[
K_t \left( \frac{K_f}{K_{t_0}} \frac{K_f}{K_{t_0}} \frac{C_A}{C_A} \frac{P_0}{C_A} \right)
\]

\[
= 8.798.337 \cdot \frac{3.120.000}{6.000.000} \frac{2.939.050}{5.878.100} \frac{23.512.376}{2.939.050} \frac{2.685.126}{23.512.376}
\]

\[
= 8.798.337 \cdot 0.6819 \cdot (0.52 - 0.5) \cdot 8 \cdot 0.1142 =
\]

\[
= 8.798.337 \cdot 0.6819 \cdot 0.02 \cdot 8 \cdot 0.1142 = +109.624,435 RON
\]

4. The influence of turnover to 1 RON operating fixed capital (efficiency of fixed capital):

\[
K_t \left( \frac{K_f}{K_{t_0}} \frac{K_f}{K_{t_0}} \frac{C_A}{C_A} \frac{P_0}{C_A} \right)
\]

\[
= 8.798.337 \cdot 0.6819 \cdot \frac{3.120.000}{6.000.000} \frac{29.382.540}{3.120.000} \frac{23.512.376}{2.939.050} \frac{2.685.126}{23.512.376}
\]

\[
= 8.798.337 \cdot 0.6819 \cdot 0.52 \cdot (-9.4175 - 8) \cdot 0.1142 =
\]

\[
= 8.798.337 \cdot 0.6819 \cdot 0.52 \cdot -1.4175 \cdot 0.1142 = +505.026,071 RON
\]

5. The influence of medium profit to 1 RON turnover:

\[
K_t \left( \frac{K_f}{K_{t_0}} \frac{K_f}{K_{t_0}} \frac{C_A}{C_A} \frac{P_0}{C_A} \right)
\]

\[
= 8.798.337 \cdot 0.6819 \cdot \frac{3.120.000}{6.000.000} \frac{29.382.540}{3.120.000} \frac{4.750.000}{29.382.540} \frac{2.685.126}{23.512.376}
\]

\[
= 8.798.337 \cdot 0.6819 \cdot 0.52 \cdot -9.4175 \cdot (0.1617 - 0.1142) =
\]

\[
= 8.798.337 \cdot 0.6819 \cdot 0.52 \cdot -9.4175 \cdot 0.0475 = +1.395,577,199 RON
\]

Diagnosis based on the pattern used illustrates the following issues of phenomena: increase total capital in the previous period showed a positive influence on
profits afferent to the turnover; technical composition of capital adversely affect profits for the turnover; increasing technological composition of fixed capital (the share of fixed capital in total fixed capital asset) is a positive contribution on profits for the turnover; turnover to 1 RON fixed capital asset reflects its efficiency as one and can be an important determinant of income growth for the turnover; increase profits at 1 RON turnover contribute to increased company profits.

The second model highlights the commercial rate of return. Factorial explanation is similar to the above one and is based on the following influences:

1. Influence of total capital (fixed and circulating):

\[
\frac{1}{100} \left[ (K_{t_1} - K_{t_0}) \frac{K_f}{K_t} \frac{K_f}{K_t} \frac{C_A}{K_f} \right] \bar{R}_0 = \frac{1}{100} \left[ \frac{(8.798.337 - 8.490.586)}{5.878.100} \frac{2.939.050}{23.512.376} \right] -11.42 = \frac{1}{100} \left[ \frac{(307.751 - 0.6923 - 0.5 \cdot 8)}{11.42} = +97.323 \, 989 \, RON \right]
\]

2. Influence of fixed capital share in total real capital (technical structure of capital):

\[
\frac{1}{100} \left[ K_{t_1} \left( \frac{K_f}{K_t} \frac{K_f}{K_t} \frac{K_f}{K_t} \frac{C_A}{K_f} \right) \right] \bar{R}_0 = \frac{1}{100} \left[ \frac{8.798.337}{6.000.000} \frac{5.878.100}{5.878.100} \frac{2.939.050}{23.512.376} \right] -11.42 = \frac{1}{100} \left[ \frac{(8.798.337 - 0.6923 - 0.5 \cdot 8)}{11.42} = +41.798 \, 436 \, RON \right]
\]

3. Influence of operating fixed capital in total fixed capital (technological structure of fixed capital):

\[
\frac{1}{100} \left[ K_{t_1} \frac{K_f}{K_t} \left( \frac{K_f}{K_t} \frac{K_f}{K_t} \frac{C_A}{K_f} \right) \right] \bar{R}_0 = \frac{1}{100} \left[ \frac{8.798.337}{3.120.000} \frac{3.120.000}{6.000.000} \frac{2.939.050}{2.939.050} \right] -11.42 = \frac{1}{100} \left[ \frac{(8.798.337 - 0.6819 - 0.52 - 0.5 \cdot 8)}{11.42} = +109.624 \, 435 \, RON \right]
\]

4. Influence of turnover to 1 RON operating fixed (efficiency of fixed capital):
5. Influence of economic rate of return:

\[
\frac{1}{100} \left[ \frac{K_t}{K_t} - \frac{K_f}{K_f} \left( \frac{CA}{K_f} - \frac{CA}{K_f} \right) \right] \bar{R}_n = \frac{1}{100} \left[ 8.798.337 \cdot 0.6819 \cdot 3.120.000 \left( \frac{29.382.540}{3.120.000} - \frac{23.512.376}{2.939.050} \right) \right] -11,42 = \\
= \frac{1}{100} \left[ 8.798.337 \cdot 0.6819 \cdot 0.52 \cdot (9.4175 - 8) \right] -11,42 = \\
= \frac{1}{100} \cdot (8.798.337 \cdot 0.6819 \cdot 0.52 \cdot 1,4175) -11,42 = +505.026,071 RON
\]

In order to facilitate the image through the synthesis of factors above mentioned on the profit mass afferent to turnover, we present the following schedule:

\[
\Delta K_t = +97.323,989 \text{ ron} \\
\Delta \frac{K_f}{K_t} = -41.798,436 \text{ ron} \\
\Delta P = +2.064,874 \text{ ron} \\
\Delta \frac{K_f}{K_f} = +109.624,435 \text{ ron} \\
\Delta \frac{CA}{K_f} = +505.026,071 \text{ ron} \\
\Delta \frac{P}{CA} = +1.395.577,199 \text{ ron}
\]

Figure 1. Synthesizing the influence of factors on profits afferent to turnover
Influence of total capital with plus sign does not mean unconditional a positive status in the sense that its volume has increased the amount of profit by about one hundred thousand RON. Here we have to take into account some internal issues:
The first is the total capital structure of two components: fixed and circulating capital.

Logical, the second factor $\Delta \frac{K_f}{K_t}$ illustrates actually the inequalities $\frac{K_f}{K_t} < \frac{K_f}{K_t_0}$, respectively $\frac{K_c}{K_t} < \frac{K_c}{K_t_0}$.

Or to increase working capital (real circulating assets) can not be assigned the same conditioning relationship as the fixed profit. Conversely, increasing the share of working capital can mean a slow rotation speed of the circulating assets and thus a negative influence on the mass of profit (in comparable conditions of the two types of capital in value terms).

Obviously, that does not automatically mean a negative state as long as turnover dynamics ahead on the components of working capital assets, respectively $I_{CA} > I_{Kc}$ (index of turnover is higher then the circulating asset capital).

Related to the structure itself of fixed capital illustrated by the share of processing capital $\frac{K_{fa}}{K_f}$ respectively the technological structure of the first, it reflects a positive share, thus $\frac{K_{fa}}{K_f} > \frac{K_{fa}}{K_{fa_0}}$ fact illustrated also in increasing the profit mass.

In the management company can be observed the favourable trend of investment policy (putting into service of new fixed operating assets). The same effect can be observed the influence of turnover growth to 1 RON fixed capital asset, increase its efficiency characterized on the basis of turnover. In fact between the technological composition of capital and total fixed capital efficiency is a parabolic correlation type such as: $y = a + b \cdot x + c \cdot x^2$, consisting of: $y$ - efficiency of fixed capital characterized on the basis of turnover; $x$ - the share of fixed operating capital in total fixed capital.
